REPORT NO.

DATE OF INFORMATION [REDACTED]

THIS IS UNEVALUATED INFORMATION

50X1-HUM

1. The special instruments subgroup of Radar Laboratory #10 was dissolved in the summer of 1949, and Dr. WOLFF, Ing. NIELBOOK [REDACTED] were transferred to the servo-mechanism section of the control and computing devices laboratory. [REDACTED] The scientific and technical head of this group was Ing. Herbert MUMBERT. KLARITZKI was the Soviet administrative head of the group. This group was divided into several sections. There was a development section under the leadership of Dr. Heinrich KINDLER, a design section under Ing. LANGENBACH, and an assembly and operational section headed by Ing. LAEMMAEKER [REDACTED] A mathematical consultant whose name was Dr. Karl BONGEL was also in the group. The personnel of Radar Laboratory #10 were not assigned to any one particular section in the MUMBERT group, but were loosely associated with all of the sections. They reported generally to KLARITZKI.

2. The first project the servo-mechanism group worked on was the 50X1-HUM continuation of a project [redacted] assigned while with Radar Laboratory #10. [redacted] computations for a dielectric constant and dissipation factor measuring device. The device was for measurements at the 10 centimeter band. This instrument never even progressed to a completed circuit design. [redacted] turned the computations over to the Radar Laboratory #10 and never even heard anymore about it. 50X1-HUM of  $\epsilon$  were to be measured from 1 to 100, and tan delta from  $10^{-2}$  to  $10^{-3}$ . The device was to have been used for the examination of 50X1-HUM materials at UHF for very high capacity condensers for possible radar installation uses. No details of this possible radar installation were made available to the Germans. [redacted] worked on this project 50X1-HUM for about two or three weeks. 50X1-HUM
3. After the project was completed, Dr. WOLFF [redacted] did absolutely nothing for six months. [redacted] simply reported for work and passed the time away. [redacted] the Soviets had no real reason for assigning 50X1-HUM to this section, and simply put [redacted] there to get [redacted] out of Radar Laboratory #10. [redacted] the MUMMERT group [redacted] were working on electro-mechanical problems connected with computers. 50X1-HUM During the end 50X1-HUM one completed computer which [redacted] had been completed by the MUMMERT group about 1950. [redacted] In size it occupied a space about 2 x 2 x 50X1-HUM meters. 50X1-HUM
4. Finally Dr. WOLFF went to KLARITZKI and asked if he [redacted] could work on computers. KLARITZKI said we could not be assigned to any work of this sort. However, in about a month, he called in Dr. WOLFF and told him that he, NIELBOCK [redacted] should solve a particular problem 50X1-HUM computing and control laboratory by purely electronic, instead of electromechanical means, as had been done to date. This problem was the determination of the sine of an angle from a determination of the angle itself. No specifications were furnished Dr. WOLFF about the eventual use of this development, but it obviously was for a computer of some sort. Dr. WOLFF [redacted] felt that the Soviets had more or less assigned [redacted] this project as "busy work" in an attempt to keep 50X1-HUM occupied. Enclosure (A) represents the circuit diagram of this computer. 50X1-HUM
5. [redacted] next designed a DC vacuum tube voltmeter, more or less as 50X1-HUM private project. This had an input impedance of 10 ohms. It utilized a center zero, mirror scale 200 uA movement which had a two per cent of full scale accuracy. Its internal resistance was 850 ohms. The lowest measuring range of the voltmeter was 0 to 100 microvolts. Enclosure (B) shows the circuit diagram of this 50X1-HUM device. 50X1-HUM
6. The same material difficulties plagued [redacted] in the servo-mechanism group as in Radar Laboratory #10, although to not quite the same degree, since [redacted] now beginning to receive components of Soviet manufacture in greater quantity. The 200 microampere basic electrical meter movement described in paragraph 5 was the most sensitive movement (current [redacted] of Soviet manufacture. This was first encountered in July of 1950 and it was really of excellent design and manufacture. [redacted] mentioned in paragraph 3 did not incorporate the all-electronic determination of sin  $\theta$  developed by Dr. WOLFF [redacted] 50X1-HUM

7. [redacted] During 1952 [redacted] no assigned projects and only had to report to work on time. [redacted] spent the rest of [redacted] time building various personal projects, such as television sets, etc. 50X1-HUM 50X1-HUM

8. STATESNY and MENSEN were still in Leningrad. [redacted] they were not, in February 1953, or for some time previous to that date, working for the Soviets. MUMMERT was still in Leningrad and working at NII-49 [redacted] LAWITSCKA [redacted] visited the STATESNY apartment group. [redacted] 50X1-HUM 50X1 50X1-HUM

9. [redacted] Soviet Sector of Berlin [redacted] the Scientific and Technical Office of Instrumentation. Dr. WELLER was the German technical head, and the German administrative chief was SCHLAGEL. POGARDIN, was the Soviet head. [redacted] carrying on development work in dm band instrumentation, and [redacted] output power meter. [redacted] 50X1-HUM 50X1-HUM

[redacted] Comments: This report, paragraph 5, contains the first information [redacted] that the Soviets can commercially produce a basic electrical meter movement of greater current sensitivity than 1 milliamperes full scale. It should be noted that this instrument was first encountered in the summer of 1950. The internal resistance seems very low for a current sensitivity of this magnitude, and indicates a rather high degree of design and manufacturing skill. The computer [redacted] mentioned in paragraph 2 must have been a fire control device. 50X1-HUM

Impulse scheduling and block diagram.

The accuracy of the instrument depends first on the distortion factor of the sin wave generator.

Second, it depends on the linearity of the time base. Third, it depends on the accuracy of setting of the transmitting potentiometer.

Tests were made without taking the accuracy of the calculation into consideration. In the first place the practicability of the instrument was to be examined. For the breadboard model the following reference sin wave voltage was used:

- (a) a power frequency of 50 cps.
- (b) an audio generator (beat frequency generator, giving 500 cps). Figure 2 was used.

The generator for the reference frequency in the finished stage should have been a 500 cps source, with a small distortion factor (which was to have been developed separately). The RC time base (4) should have been replaced in the finished product by one of greater linearity (Phantastron). The total diagram corresponds in principle to a time modulation circuit of great accuracy.

Shown on Figure No.1

- 1. Sin wave generator
- 2. Limiter
- 3. Differential stage
- 4. Linear time bases (saw tooth) initially an RC circuit with switching tube
- 5. Compensation stage
- 6. Precision transmission potentiometer, scale for setting of  $\theta$  value 0 to 270 degrees.
- 7. Impulse amplifier (A) amplifier output
- 8. Coincidence stage (gated pentode)
- 9. Peak voltage stage
- 10. 90 degree phase shifter for cosine function

LEGEND TO THE SKETCH OF THE DC VACUUM TUBE VOLTMETER

- (1) Normal power supply with filter. Full wave rectifier tube, 6 x 5 (Soviet copy), plate DC voltage equal plus 250 volts. Transformer TR1 for all filament supply.

- (2) Telegraph relay used as chopper (Soviet copy of Siemens relay).

Supply given by a, b, equal 4 volts, 50 cps

C1 = 0.25 uf

R1 and R2 = input voltage divider, calibrated for range 1 = 1 mV  
range 2 = 10 mV

Total value R1 plus R2 approx. equal 1 megohm.

S1 = range selection switch

R3 = approx. 500,000 ohms

T1 and T2 double triode 6SL7

2 stage selective amplifier for 50 cps operation.

R4 = 10,000 ohms

R5 = 250,000 ohms

C3 = 25 uf, 20 volts, electrolytic condenser

F1 = double T filter with anti-resonance at 50 cps contains elements:

R20 = 3 megohm

R21 = 3 megohm

R22 = 1.5 megohm

C8 and C9 = unknown

C10 = unknown

Filter as closed unit in shielded cage

C2 = 0.25 uf

R6 = approx. 500,000 ohms

R7 = 1,000 ohms

C4 = 100 uf, 20 volts, electrolytic condenser

TR2 plate transformer, iron cross-section 16 x 16 mm. normal core, primary winding.

secondary, 2 x 24,000 turns, center tapped.

T5 and T6 = double diode, 6H6 (Soviet copy of RCA) phase discriminator  
c and d = carrier voltage
